## Experiment-6

**Aim:** To solve problems using Prolog Programming and solve the given 5 tasks that are list operations and Huffman coding.

### Problem statements:

- 1) Create a family tree using PROLOG. It should have rules for father, mother, brother, sister, grandparent, uncle, aunt, predecessors, successors.

### Code:

```
1 parent(bebi,jayaram).
2 parent(umesh,jayaram).
3 parent(umesh,raghu).
4 parent(bebi,raghu).
5 parent(kusum, vivek).
6 parent(jayaram, vivek).
7 parent(chandra, divya).
8 parent(shekhar, divya).
9 parent(loku, kusum).
10 parent(sharadha, kusum).
11 parent(sharadha, chandra).
12 parent(loku, chandra).
13 parent(chandra, bhavya).
14 parent(shekhar, bhavya).
15 parent(kusum, moresh).
16 parent(jayaram, moresh).
17 female(bebi).
18 female(kusum).
19 female(bhavya).
20 female(divya).
21 female(chandra).
22 female(sharadha).
23 male(shekhar).
24 male(raghu).
25 male(jayaram).
26 male(moresh).
27 male(vivek).
28 male(loku).
```

```

29 male(umesh).
30 %rules
31 predecessor(X, Y) :- parent(X, Y).
32 predecessor(X, Y) :- parent(X, A),predecessor(A, Y).
33 successor(X, Y):- son(X,Y).
34 successor(X, Y):- daughter(X, Y).
35 successor(X, Y):- son(X, A), successor(A, Y).
36 successor(X, Y):- daughter(X, A), successor(A, Y).
37 grandfather(X, Y):- parent(X, A), parent(A, Y), male(X).
38 grandmother(X, Y):- parent(X, A), parent(A, Y), female(X).
39 mother(X, Y):- parent(X, Y), female(X).
40 father(X, Y):- parent(X, Y), male(X).
41 aunt(X, Y):- sister(X, Z), parent(Z, Y).
42 uncle(X, Y):- brother(X, Z), parent(Z, Y).
43 sister(X, Y):- parent(A, X), parent(A, Y), female(X), X \= Y.
44 brother(X, Y):- parent(A, X), parent(A, Y), male(X), X \= Y.
45 son(X, Y):- parent(Y, X), male(X).
46 daughter(X, Y):- parent(Y, X), female(X).

```

## Output:

<code>predecessor(loku,X)</code> <b>X</b> = kusum <b>X</b> = chandra <b>X</b> = vivek <b>X</b> = moresh <b>X</b> = divya <b>X</b> = bhavya	<code>successor(vivek,X)</code> <b>X</b> = kusum <b>X</b> = jayaram <b>X</b> = loku <b>X</b> = sharadha <b>X</b> = bebi <b>X</b> = umesh
?- <code>predecessor(loku,X)</code>	?- <code>successor(vivek,X)</code>
<code>grandfather(loku,X)</code> <b>X</b> = vivek <b>X</b> = moresh <b>X</b> = divya <b>X</b> = bhavya	<code>grandmother(X,bhavya)</code> <b>X</b> = sharadha Next 10 100 1,000 Stop
?- <code>grandfather(loku,X)</code>	?- <code>grandmother(X,bhavya)</code>
<code>mother(kusum,X)</code> <b>X</b> = vivek <b>X</b> = moresh	<code>father(X,jayaram)</code> <b>X</b> = umesh
?- <code>mother(kusum,X)</code>	?- <code>father(X,jayaram)</code>
<code>aunt(X,bhavya)</code> <b>X</b> = kusum Next 10 100 1,000 Stop	
?- <code>aunt(X,bhavya)</code>	

`sister(bhavya,X)`

**X =** divya

---

?- `sister(bhavya,X)`

`daughter(chandra,X)`

**X =** sharadha

---

?- `daughter(chandra,X)`

`son(raghu,X)`

**X =** umesh

---

?- `son(raghu,X)`

`brother(vivek,X)`

**X =** moresh

---

?- `brother(vivek,X)`

Given a list [a,a,a,a,b,b,b,c,c] write a function that does the following `rle([a,a,a,a,b,b,b,c,c],X)` X: [a,b,c]

**Code:**

%stopping condition

`remove_duplicates([X],[X]).`

%if next element is same

`remove_duplicates([H, H|T],X) :-`

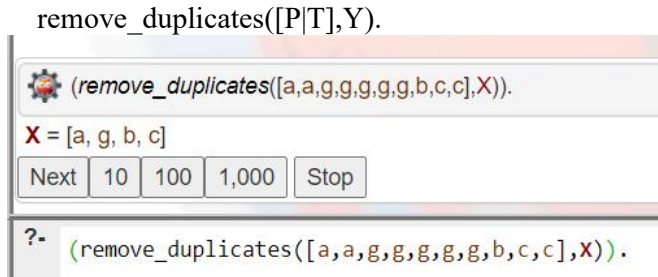

`remove_duplicates([H|T],X).`

%if next element not same

`remove_duplicates([H, P|T],[H|Y]) :-`

`H\=P,`

```
remove_duplicates([P|T],Y).
```

```
(remove_duplicates([a,a,g,g,g,g,b,c,c],X)).
```

X = [a, g, b, c]

Next 10 100 1,000 Stop

```
?- (remove_duplicates([a,a,g,g,g,g,b,c,c],X)).
```

- 3) Given a list [a,b,c,d,e,f,g] write a function that does the following  
 slice([a,b,c,d,e,f,g],2,5,X) X: [c,d,e,f]

**Code:**

```
% puts last value of slice in output
list slice([X|_], 0, 0, [X]).
```

```
% called until last slice index is reached
```

```
slice([X|T], 0, L, [X|T_new]) :- L > 0, L_new is L - 1, slice(T, 0, L_new, T_new).
```

```
% called until initial slice index is reached
```

```
slice([_|T], F, L, Output) :- F > 0, F_new is F - 1, L_new is L - 1, slice(T, F_new, L_new, Output).
```

```
?- slice([a,b,c,d,e,f,g],2,5,X).
```

X = [c, d, e, f]

Next 10 100 1,000 Stop

- 4) Group list into sublists according to the distribution given For example  
 subsets([a,b,c,d,e,f,g],[2,2,3],X,[]) should return X = [[a,b][c,d][e,f,g]] The order of the  
 list does not matter

**Code:**

```
el(X,[X|L],L).
```

```
el(X,[_|L],R) :-
```

```
    el(X,L,R).
```

```
selectN(0,_,[]) :- !.
```

```
selectN(N,L,[X|S]) :-
```

```
    N > 0,
```

```
    el(X,L,R),
```

```
    N1 is N-1,
```

```
    selectN(N1,R,S).
```

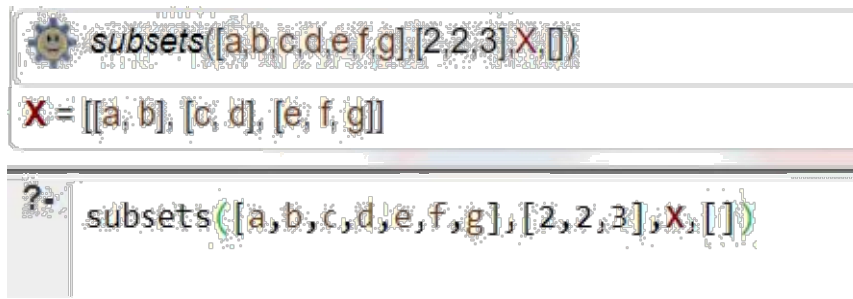

```
subsets([],[],[],[]).
```

```
subsets(G,[N1|Ns],[G1|Gs],[]) :-
```

```
    selectN(N1,G,G1),
```

```
    subtract(G,G1,R),
```

```
    subsets(R,Ns,Gs,[]).
```

- 5) Huffman Code We suppose a set of symbols with their frequencies, given as a list of  $fr(S,F)$  terms. Example:  $[fr(a,45), fr(b,13), fr(c,12), fr(d,16), fr(e,9), fr(f,5)]$ . Our objective is to construct a list  $hc(S,C)$  terms, where  $C$  is the Huffman code word for the symbol  $S$ . In our example, the result could be  $Hs = [hc(a,'0'), hc(b,'101'), hc(c,'100'), hc(d,'111'), hc(e,'1101'), hc(f,'1100')]$ . The task shall be performed by the predicate `huffman/2` defined as follows: `% huffman(Fs,Hs) :- Hs is the Huffman code table for the frequency table Fs`

**Code:**

```
huffman(Fs,Cs) :-
    initialize(Fs,Ns),
    make_tree(Ns,T),
    traverse_tree(T,Cs).

initialize(Fs,Ns) :- init(Fs,NsU), sort(NsU,Ns).

init([],[]).
init([fr(S,F)|Fs],[n(F,S)|Ns]) :- init(Fs,Ns).

make_tree([T],T).
make_tree([n(F1,X1),n(F2,X2)|Ns],T) :- F is
    F1+F2,
    insert(n(F,s(n(F1,X1),n(F2,X2))),Ns,NsR),
    make_tree(NsR,T).

insert(N,[],[N]) :- !.
insert(n(F,X),[n(F0,Y)|Ns],[n(F,X),n(F0,Y)|Ns]) :- F < F0, !.
insert(n(F,X),[n(F0,Y)|Ns],[n(F0,Y)|Ns1]) :- F >= F0, insert(n(F,X),Ns,Ns1).

traverse_tree(T,Cs) :-
    traverse_tree(T,"",Cs1-[]), sort(Cs1,Cs),
    write(Cs).

traverse_tree(n(_,A),Code,[hc(A,Code)|Cs]-Cs)
    :-atom(A).

traverse_tree(n(_,s(Left,Right)),Code,Cs1-Cs3)
    :-atom_concat(Code,'0',CodeLeft),
    atom_concat(Code,'1',CodeRight),
```

```
traverse_tree(Left,CodeLeft,Cs1-Cs2),  
traverse_tree(Right,CodeRight,Cs2-Cs3).
```

```
huffman([fr(a,45),fr(b,13),fr(c,12),fr(d,16),fr(e,9),fr(f,5)],_)  
[hc(a, 0), hc(b, 101), hc(c, 100), hc(d, 111), hc(e, 1101), hc(f, 1100)]  
true  
?- huffman([fr(a,45),fr(b,13),fr(c,12),fr(d,16),fr(e,9),fr(f,5)],_)
```

### Conclusion:

The goal of this experiment was to learn prologue programming and complete five tasks including list operations such as duplicate removal, slicing, subsets, and huffman coding, as well as generating a family tree and answering a few questions. The Huffman coding algorithm is a lossless data compression method. The concept is to give variable-length codes to input characters, the lengths of which are determined by the frequency of the related characters. The smallest code is assigned to the most frequently occurring character, whereas the largest code is assigned to the least frequently occurring character. Rules, facts, and queries are the three basic constructs of Prolog. Prolog programs are essentially knowledge bases, consisting of rules, facts, and questions, the answers to which are sought from this knowledge base and sent as a boolean value. The language Prolog is utilised in AI because it facilitates the administration of recursive techniques and pattern matching.
